## CUBIC GRAPHS

A cubic equation is an equation where the highest power of the variable (usually ' $x$ ') is a cube $\left.{ }^{3}\right)$. In other words, the equation will contain an $x^{3}$ term and could contain, at most, three other terms; an $x^{2}$ term, an $x$ term and a constant. It will not contain terms with any other powers such as $x^{4}, x^{5} \ldots$ or $x^{-1}, x^{-2} \ldots$
The graph of a cubic equation is a curve.

## When the

 coefficient of $x^{3}$ is positive, the curve will look something like this:

When the coefficient of $x^{3}$ is negative, the curve will look something like this:

To draw a cubic graph, you would need to complete a table of values that satisfy your cubic equation.
Follow these steps to draw the graph of $y=x^{3}$.

1. First, complete a table of values.
2. To calculate the values for the table, substitute the values for $x$ into the equation to find the values of $y$.

| $\boldsymbol{y}$ | -3 | -2 | -1 | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{y}=\boldsymbol{x}^{3}$ | -27 | -8 | -1 | 0 | 1 | 8 | 27 |

3. Then, draw the graph using these points.

Your graph should look like the one on the right.

## USING A GRAPH TO SOLVE A CUBIC EQUATION

The solutions to the cubic equation
$a x^{3}+b x^{2}+c x+d=0$ are called the roots of the equation. They are the values of $x$ where the curve, $a x^{3}+b x^{2}+c x+d=0$, crosses the $x$-axis, since at those points, $y=0$.
The graph shows there are three solutions to $x^{3}+2 x^{2}-5 x-6=0$ and these are
$x=-3, x=-1$ and $x=2$.

Check that you can:

- draw quadratic graphs, (look at the intermediate knowledge organizer)
- substitute values into an equation to find an answer
- find the reciprocal of a number or a fraction.

## RECIPROCAL GRAPHS

The graph of $y=\frac{1}{x}$ is shown on the right. This is an example of a reciprocal function.
This type of graph is a smooth curve called a hyperbola.
When $x$ is very small, $y$ is very large.
When $x$ is very large, $y$ is very small.
The curve gets very close to both axes, but never touches them.
There is a break in the graph when $x=0$ since
 division by zero is undefined.
The graph has rotational symmetry of order 2 about the origin.
You can draw a reciprocal graph in the same way as you draw a quadratic or cubic graph:

- Complete a table of values, by substituting in values for $x$ into the equation to find the
values of $y$.
- Draw the graph using these points.

## EXPONENTIAL GRAPHS

An exponential equation is an equation where the unknown is the exponent, e.g. $y=2^{x}, y=3^{x}$ and $y=5^{x}$.
Here on the right is the graph of $\boldsymbol{y}=\mathbf{2}^{x}$ :
The exponential graph is continuous (there are no breaks).
The curves all increase quite rapidly; as $x$ increases, $y$ increases.
The curves get very close to the $x$-axis, but never touch it.
You may have noticed that all the curves in the

graphs crossed the $y$-axis at the same point $(0,1)$.
You can draw an exponential graph in the same way as described earlier.

## REMEMBER!

Study the shape and features of these three types of graphs so that you can learn to recognise them.
