## E <br> wjec cbac

## The $n$th term

A sequence is a number pattern that follows a rule. We can find any term in a sequence using the $n$th term rule and knowing the position of the term we want within the sequence i.e $1^{\text {st }}(n=1), 2^{\text {nd }}(n=2), 3^{\text {rd }}(n=3) \ldots 50^{0^{\text {h }}}(n=50)$.

## Finding the $n$th term rule - Linear sequences

Linear sequences The difference between the terms of a linear sequence is always the same

## Example Find the $n$th term for the following sequences <br> a) $3,6,9,12,15 \ldots$ | $n$ | 1 | 2 | 3 | 4 | 5 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| term | 3 | 6 | 9 | 12 | 15 |

## The difference is +3 .

Multiplying $n$ (the position) by 3 gives the term. $n$th term $=3 \times n$

## $n$th term $=3 n$

d) $7,10,13,16,19$.

The difference is +3 (as in the sequence above).
The $n$th term rule starts with $3 n$.
Comparing the sequence with $3 n$ we see each term has moved up four places (+4). $n$th term $=3 n+4$
b) $5,10,15,20,25 \ldots$

| $n$ | 1 | 2 | 3 | 4 | 5 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| term | 5 | 10 | 14 |  | 20 |
| +5 | 25 |  |  |  |  |

## The difference is +5 .

Multiplying $n$ (the position) by 5 gives the term. $n$th term $=5 \times n$
$n$th term $=5 n$
e) $2,7,12,17,22$.

The difference is +5 (as in the sequence above).
The $n$th term rule starts with $5 n$.
Comparing the sequence with $5 n$ we see each term has moved down three places ( -3 ). $n$th term $=5 n-3$
c) $-2,-4,-6,-8,-10 \ldots$

| $n$ | 1 | 2 | 3 | 4 | 5 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| term | -2 | -4 | -6 | -8 | -10 |

## The difference is -2

Multiplying $n$ (the position) by -2 gives the term. $n$th term $=-2 \times n$

$$
n \text {th term }=-2 n
$$

f) $4,2,0,-2,-4 \ldots$

| $n$ | 1 | 2 | 3 | -2 | $4-2$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| term | 4 | 2 | 0 | -2 | -4 |

The difference is -2 (as in the sequence above). The $n$th term rule starts with $-2 n$. Comparing the sequence with $-2 n$ we see each term has moved up six places ( +6 ) from $-2 n$. $n$th term $=-2 n+6$

## Using the $n$th term rule

| Finding terms within a linear sequence |  | Determining if a term is in a sequence |  |
| :---: | :---: | :---: | :---: |
| 1) Find the first three terms of the | 2) Find the $100^{\text {th }}$ term of the sequence with $n$th term $=-4 n+8$. | Determine if 254 is a term in the sequence $n$th term $=3 n-2$. |  |
| sequence with $n$th term $=3 n-4$. <br> If $n=1$ then $3 \times 1-4=\mathbf{- 1}$ |  |  | Write and solve an equation using the term and the $n$th term rule. If $n$ (the term's |
| If $n=\mathbf{2}$ then $3 \times 2-4=\mathbf{2}$ | If $n=100$ then $-4 \times 100+8=\mathbf{- 3 9 2}$ | $3 n-2=254$ | position) is a whole number, then the term |
| If $n=3$ then $3 \times 3-4=\mathbf{5}$ | $100^{\text {th }}$ term $=-392$ | $3 n=256$ | d |
| $-1,2,5, \ldots$ |  | $n=\frac{256}{3}$ | therefore 254 cannot be in the sequence |

## Finding terms within a quadratic sequence

1) Find the first three terms of the sequence with $n$th term $=n^{2}+5$.
If $n=1$ then $1^{2}+5=\mathbf{6}$
If $n=\mathbf{2}$ then $\mathbf{2}^{2}+5=\mathbf{9}$
If $n=\mathbf{3}$ then $\mathbf{3}^{2}+5=\mathbf{1 4}$

## Check that you can:

recognise simple number patterns
find the next term in a number pattern using the simple term-to-term rule

$$
\text { e.g. } \underbrace{7,}_{+4+4} \underbrace{11,}_{+4} \underbrace{15,}_{+4} \underbrace{19}_{+4}
$$

draw the next diagram in a pattern
substitute values into expressions.

## Finding the $n$th term rule - Quadratic sequences

Quadratic sequence The $n$th term rule for a quadratic sequence will contain $n^{2}$ and this will be the highest power of $n$.

The first difference between each term of a quadratic sequence changes (although it will follow a pattern) so we the look at the second difference, which stays the same.
If the second difference is $2 a$ then the sequence starts with $a n^{2}$.
E.g. if the second difference is 2 , the sequence starts with $n^{2}$. If the second difference is 4 the sequence starts with $2 n^{2}$

## Example Find the $n$th term for the following sequences.

|  |  |  |  | 2) Draw a table and compare $n^{2}$ with the sequence. |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $n$ |  |  | 1 |  | 2 | 3 | 4 | 5 |  |
|  |  |  |  | $n^{2}$ |  |  |  |  | 4 | 9 | 16 | 25 |  |
|  |  |  |  | term |  |  |  |  | 6 | 11 | 18 | 27 |  |
| 1) The second difference is +2 so the sequence starts with $n^{2}$ |  |  |  | 3) Each term has moved up two places (+2) from $n^{2}$. $n$th term $=n^{2}+2$ |  |  |  |  |  |  |  |  |  |
| b) $-1,8,23,44,71 \ldots$ |  |  |  | 2) Draw a table and compare $3 n^{2}$ with the sequence. |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  | 1 | 2 |  | 3 | 4 | 5 |  |
|  |  |  |  | $3 n^{2}$ |  |  | 3 | 12 |  | 27 | 48 | 75 |  |
| 1) The second difference is +6 so the sequence starts with $3 n^{2}$. |  |  |  | term |  |  | 1 | 8 |  | 23 | 44 | 71 |  |
|  |  |  |  | ) Each term has moved down four places (-4) from $3 n^{2}$. |  |  |  |  |  |  |  |  |  |
| c) 1 |  |  | 4 43 |  |  |  | 3) The difference is a linear sequence $(b n+c)$. Solve it the same way as the method on the left. |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  | 1 | 2 | 3 | 4 | 5 |
|  |  |  |  |  |  | Linear |  |  | 8 | 9 | 10 | 11 | 12 |
| 1) The second difference is +4 so the sequence starts with $2 n^{2}$. <br> 2) Draw a table and compare $2 n^{2}$ with the sequence (subtract $2 n^{2}$ from the term). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $n$ | 1 | 2 | 3 | $4{ }^{4} 5$ |  | 5) Compare the linear term with $+1 n$. <br> The term has moved +7 places from $+1 n$. |  |  |  |  |  |  |  |
| $2 n^{2}$ | 2 | 8 | 18 | 32 | 50 |  |  |  |  |  |  |  |  |
| term | 10 | 17 | 28 | 43 | 62 | The linear term is $n+7$. <br> The final quadratic sequence is $2 n^{2}+n+7$. |  |  |  |  |  |  |  |
| term - $2 n^{2}$ | 8 | 9 | 10 | 11 | 12 |  |  |  |  |  |  |  |  |

[^0]\[

$$
\begin{aligned}
& \text { If } n=1 \text { then } 2 \times 1^{2}-1=\mathbf{1} \\
& \text { If } n=\mathbf{2} \text { then } 2 \times \mathbf{2}^{2}-4=\mathbf{7} \\
& \text { If } n=\mathbf{3} \text { then } 2 \times \mathbf{3}^{2}-1=\mathbf{1 7}
\end{aligned}
$$
\]

Don't forget to check your $n$th term rule by substituting the $n$ values back into your rule in order to get the terms.

Remember that $n$ is the position of the term within the sequence so it's this 'position' that we substitute into our rule in order to find the term.

[^0]:    2) Find the first three terms of the sequence with $n$th term $=2 n^{2}-1$
